

# Battery Safety (Maintenance)

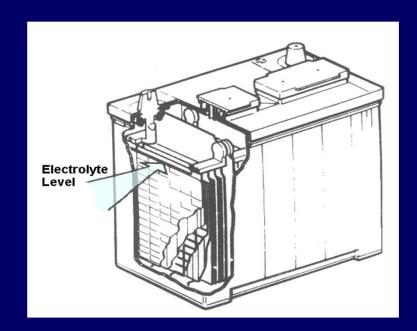

Safety Precautions

## EAWR (Regulation 12)

**Isolation?** 

## Protective Clothing (PPE)

Eye protection must be worn (Full face?)

Rubber gauntlet gloves & possibly gaiters on arms and legs

Also a full length rubber apron

### Mixing Electrolyte

When diluting concentrated electrolyte to the required specific gravity

**Distilled water** must be used and it should

Never
be added to the
concentrated solution or a
serious explosion may
result

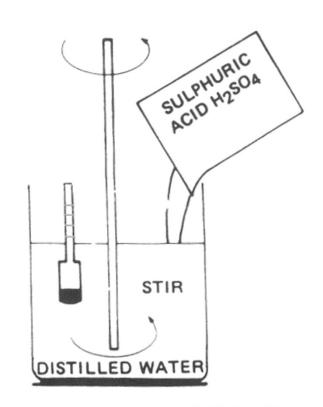

Fig. 5.17 Mixing acid and distilled water

#### Burns

Diluted Sulphuric Acid is the electrolyte in lead acid batteries.

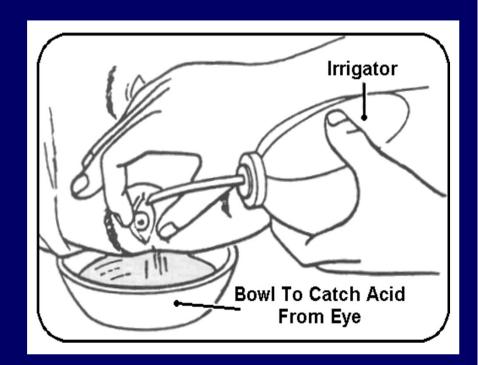

Alkaline batteries use a solution of Potassium Hydroxide

Both solutions are corrosive & will cause severe burns.

#### Acid & Alkaline Burns

Flood the affected area immediately with water for 20 minutes.

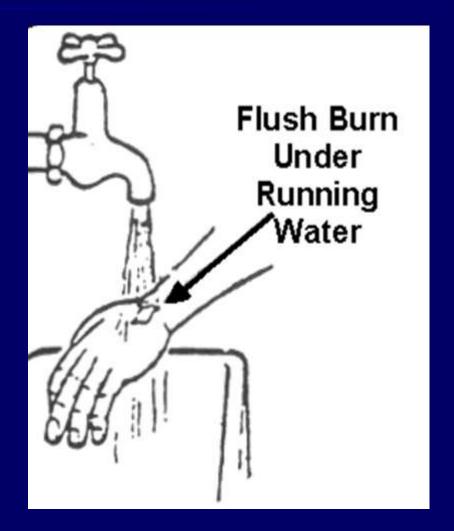

#### Acid & Alkaline Burns

ASAP Remove contaminated clothing

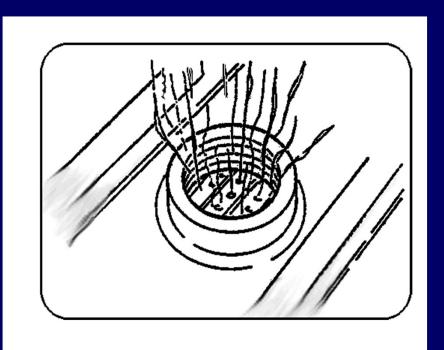

Seek medical attention

### **Explosion Risk**

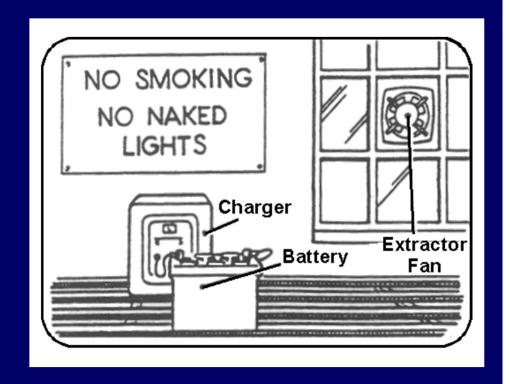

When under charge batteries give off an explosive mixture of gases, consisting of oxygen and hydrogen.

## Explosion Risk (Charging)

The charging area should be well ventilated.
Notices forbidding smoking and naked lights prominently displayed.

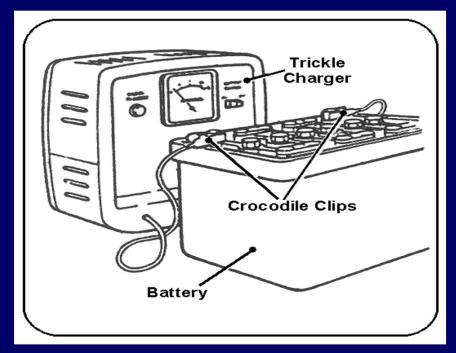

Other important things to consider Ah Rating, correct charger, Polarity, Segregation?

## Explosion Risk (Charging)

Leads should never be clipped on or off unless the charger is switched off, otherwise a spark may occur to ignite the explosive gasses.

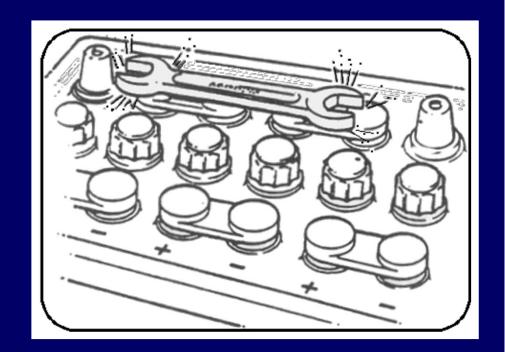

#### Short circuits

Do not allow any metal objects to short across the battery i.e. a spanner.

Could cause an explosion & will become sufficiently hot to cause severe burns.

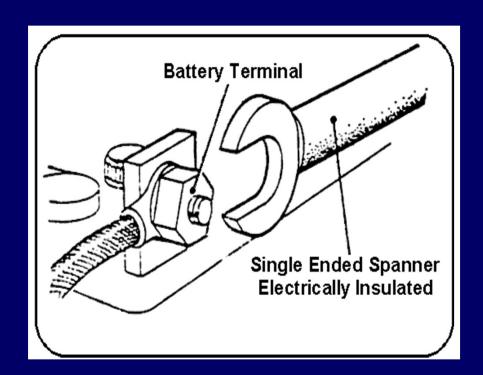

#### Avoidance of Short circuits

Use special tools or electrically insulated ones in the vicinity of batteries.

Take care if jump starting, check manufacturers data

## Correct Disposal

Do not discard dry primary cells in a normal waste bin.

Consult local procedures for correct disposal of Hazardous Waste
